Reverse Engineering Assignment Write-up

First, I opened the `Dynamic_crackme.exe` file in Ghidra.

Screenshot 1: Dynamic_crackme.exe opened in Ghidra.

After opening the file, I went to the main function and found the `check_password` function. I opened it to see how the password was being checked.

Screenshot 2: check_password function.

In the check_password function, I changed the PUSH instruction to MOV. I also changed the registers to EAX, 0x01. On the second row, I changed the ?? instruction to RET.

After making these changes, I exported the modified file and ran it. I entered a random password to test whether the patch worked.

Screenshot 3: The program showing Access Granted.

The program accepted the random password and showed **Access Granted**, which confirmed that the patch worked.
